Veronika Coltheart, 2011-01-07 In the late 1980s visual cognition was a small subfield of cognitive psychology and the standard texts mainly discussed just iconic memory in their sections on visual cognition In the subsequent two decades and especially very recently many remarkable new aspects of the processing of brief visual stimuli have been discovered change blindness repetition blindness the attentional blink newly discovered properties of visual short term memory and of the face recognition system the influence of reentrant processing on visual perception and the surprisingly intimate relationships between eyeblinks and visual cognition This volume provides up to date tutorial reviews of these many new developments in the study of visual cognition written by the leaders in the discipline providing an incisive and comprehensive survey of research in this dynamic field **Neuronal Bases And Psychological Aspects Of Consciousness - Proceedings Of The International School Of Biocybernetics**

Cloe Taddei-ferretti, C Musio, 1999-05-14 For a few decades the puzzle of consciousness which for centuries was analysed by philosophers has been finding a wide interest in the scientific field where previously it was not entitled to be a member It has become one of the most debated problems in the cognitive sciences The anatomical bases neurophysiological correlates and elementary mechanisms underlying complex processes arising with consciousness have been compared with the psychological perceptive cognitive volitive emotional aspects of conscious expressions in normal and pathological conditions Various theories which attempt to fit systematically and coherently neural and psychological data have been debated proving the emergence of the phenomenon of consciousness **Journal of Rehabilitation Research and Development**, 1998 *IBBO-International Biography and Bibliography of Ophthalmologists*

and Visual Scientist (A-Z) ,2018-11-30 **Journal of Rehabilitation Research & Development** ,1997 Integrated Models of Cognitive Systems Wayne D. Gray,2007-04-19 The field of cognitive modeling has progressed beyond modeling cognition in the context of simple laboratory tasks and begun to attack the problem of modeling cognition in more complex realistic environments such as those studied by researchers in the field of human factors The problems that the human factors community is tackling focus on modeling certain problems of communication and control that arise in the integration of implicit and explicit knowledge emotion and cognition and the cognitive system with the external environment These problems must be addressed in order to produce integrated cognitive models of moderately complex tasks This volume presents for the two main theories of control the current state of the art as well as contrasts among current approaches to human performance models *Reports of the Committee on Vision* National Research Council,Division of Behavioral and Social Sciences and Education,Commission on Behavioral and Social Sciences and Education,Committee on Vision,1990-02-01 This is a summary of reports issued since 1947 under the aegis of the National Research Council s Committee on Vision An abstract summarizing the contents of each report is provided together with information to assist the reader in obtaining copies of the information about early research efforts in such classic areas of vision science as visual search form discrimination and aging together with current problems such as the use of video display terminals The book will aid vision scientists in gaining a thorough understanding of the recent historical context of vision research **A Computational Perspective on Visual Attention** John K. Tsotsos,2021-06-22 The derivation exposition and justification of the Selective Tuning model of vision and attention Although William James declared in 1890 Everyone knows what attention is today there are many different and sometimes opposing views on the subject This fragmented theoretical landscape may be because most of the theories and models of attention offer explanations in natural language or in a pictorial manner rather than providing a quantitative and unambiguous statement of the theory They focus on the manifestations of attention instead of its rationale In this book John Tsotsos develops a formal model of visual attention with the goal of providing a theoretical explanation for why humans and animals must have the capacity to attend He takes a unique approach to the theory using the full breadth of the language of computation rather than simply the language of mathematics as the formal means of description The result the Selective Tuning model of vision and attention explains attentive behavior in humans and provides a foundation for building computer systems that see with human like characteristics The overarching conclusion is that human vision is based on a general purpose processor that can be dynamically tuned to the task and the scene viewed on a moment by moment basis Tsotsos offers a comprehensive up to date overview of attention theories and models and a full description of the Selective Tuning model confining the formal elements to two chapters and two appendixes The text is accompanied by more than 100 illustrations in black and white and color additional color illustrations and movies are available on the book s Web site
