

WIND

6.6% global electricity generation (2021)

Wind flows over the blades of a wind turbine, creating mechanical power by turning the blades.

The blades are connected to a drive shaft that turns an electric generator to produce electricity.

SOLAR

3.7% global electricity generation (2021)

Photovoltaic (PV) cells contain thin semiconductor wafers, forming an electric field.

When light hits the cell, electrons are knocked loose from the semiconductor material and move in response to the electric field.

This generates electricity, transferred through metal conductors on the PV cell.

Biomass is burned in a boiler to produce steam.

Steam rotates the blades of a turbine connected to a generator that produces electricity.

Biomass can also be converted into other liquid or gaseous fuels used to generate electricity.

GEO THERMAL

<1% global electricity generation (2021)

As the water reaches the surface, it boils over into steam, which rotates a steam turbine.

The turbine is connected to a generator that produces electricity.

Hot water from underground reservoirs is pumped using pipes or wells.

Dams or other diversion structures alter the natural flow of water to increase its elevation and volume.

Water flows through the dam, generating mechanical energy that spins a turbine connected to an electric generator.
