Body Shape:

How the Body Shapes the Way We Think Rolf Pfeifer, Josh Bongard, 2006-10-27 An exploration of embodied intelligence and its implications points toward a theory of intelligence in general with case studies of intelligent systems in ubiquitous computing business and management human memory and robotics How could the body influence our thinking when it seems obvious that the brain controls the body In How the Body Shapes the Way We Think Rolf Pfeifer and Josh Bongard demonstrate that thought is not independent of the body but is tightly constrained and at the same time enabled by it They argue that the kinds of thoughts we are capable of have their foundation in our embodiment in our morphology and the material properties of our bodies This crucial notion of embodiment underlies fundamental changes in the field of artificial intelligence over the past two decades and Pfeifer and Bongard use the basic methodology of artificial intelligence understanding by building to describe their insights If we understand how to design and build intelligent systems they reason we will better understand intelligence in general In accessible nontechnical language and using many examples they introduce the basic concepts by building on recent developments in robotics biology neuroscience and psychology to outline a possible theory of intelligence They illustrate applications of such a theory in ubiquitous computing business and management and the psychology of human memory Embodied intelligence as described by Pfeifer and Bongard has important implications for our understanding of both natural and artificial intelligence

The Role of Visual Cues in Body Size Estimation Anne Thaler, 2019-12-15 Our body is central to what we define as our self The mental representation of our physical appearance often called body image can have a great influence on our psychological health Given the increase in body mass index worldwide and the societal pressure to conform to body ideals it is important to gain a better understanding of the nature of body representations and factors that play a role in body size estimation tasks This doctoral thesis takes a multifaceted approach for investigating the role of different visual cues in the estimation of own body size and shape by using a variety of experimental methods and novel state of the art computer graphics methods Two visual cues were considered visual perspective and identity cues in the visual appearance of a body shape and color information as well as their interactions with own body size and gender High ecological validity was achieved by testing body size estimation in natural settings when looking into a mirror and by generating biometrically plausible virtual bodies based on 3D body scans and statistical body models and simulating real world scenarios in immersive virtual reality

Aleyev, 2012-12-06 1 Nekton as an ecomorphological type of biont The term nekton was suggested and used for the first time in 1890 by E Haeckel in his book Plankton Studien Etymologically the word nekton derives from the Greek VTJKTTJP i e swimming As Haeckel defined it nekton describes collectively all swimming animals that are free to choose their path i e can resist a strong current of water and distinct from planktonic animals go where they wish While giving a general idea of the dividing line between plankton and nekton Haeckel's definition which has played an important role in shaping our ideas about nekton today no longer provides a sufficient basis for ecological and functional morphological investigations since it affords no possibility of quantitatively assessing either the boundary between plankton and nekton or that between nekton and other ecomorphological types of biont Thus Parin 1968 proceeding from Haeckel's principle believes that in the epipelagic zone of the ocean the minimum size of nektonic fishes with a well developed capacity for active swimming may be between 15 and 30 cm as fishes shorter than 15 cm are unable to counter oceanic currents Meanwhile young *Leucaspius* *Leucaspius delineatus* only 1.5 cm long observed by this writer in ponds near Moscow proved capable of active horizontal migrations across the entire body of water which if Haeckel's definition is accepted brings the border between planktonic and nektonic fish in this case to between 1.5 and 2.0 cm
