Youssef F. Rashed, 2000 Plate bending problems have many applications in civil and mechanical engineering The analysis of plates using the Boundary Element Method BEM however has received little attention in existing research and literature This book presents new Boundary Element formulations for plate bending problems in which the Reissner plate bending theory is used to model the bending behaviour of the plate The author applies several integral equations to solve engineering problems relating to a building slab beam footing and simple raft and the results are compared against analytical solutions such as a finite difference method a finite element method and a three dimensional boundary element method These confirm that the Boundary Element formulations presented are a competitive alternative to existing numerical methods
