Avoiding Damage Caused By Soil Structure Interaction:

Avoiding Damage Caused by Soil-structure Interaction Richard Kastner, Jamie Standing, Oddvar Kjekstad, 2003 Increasing development in the urban environment and supporting infrastructure systems has necessitated a greater use of underground space and sites that were hitherto judged to be not economically viable e.g. because of difficult ground conditions. This presents many challenges in terms of planning, design and construction as well as the protection of existing buildings. Understanding the complex nature of soil structure interaction and the resulting ground movements is an integral part of assessing developments involving new construction, for example tunnels and deep excavations.

Guidelines for the Use of Advanced Numerical Analysis David Potts, 2002 It is not easy for engineers to gain all the skills necessary to perform numerical analysis. This book is an authoritative guide that explains in detail the potential restrictions and pitfalls and so helps engineers undertake advanced numerical analysis. It discusses the major approximations involved in nonlinear numerical analysis and describes some of the more popular constitutive models currently available and explores their strengths and weaknesses. It also discusses the determination of material parameters for defining soil behaviour, investigates the options for modelling structural components and their interface with the soil and the boundary conditions that are appropriate in geotechnical analysis and the assumptions implied when they are used. Guidelines for the use of Advanced Numerical Analysis also provides guidelines for best practice of specific types of soil structure interaction that are common in urban development and discusses the role of benchmarking exercises. This authoritative book will be invaluable to practising engineers involved in urban development. It will also be a useful tool for geotechnical and structural engineers.

Geotechnical Risk in Rock Tunnels Antnio Campos e Matos, Lu Ribeiro e Sousa, Johannes Kleberger, Paulo Lopes Pinto, 2006-06-08 Tunnels have a high degree of risk that needs to be assessed and managed. Underground works intersect and interact with natural materials incorporating their characteristics as structural components of their own stability. For this reason geotechnical risk analyses are implemented at all phases of tunnel construction from design through to post c
