Environmental Impacts of Aquaculture Kenneth D. Black, 2001 The continued expansion of aquaculture in a wide range of environments and of a growing number of species has lead to increasing demands on aquatic resources These demands vary with the culture species the culture method and the environmental and ecological setting While there are many examples of efforts to mitigate detrimental environmental effects the environment remains the ultimate constraint on the future sustainable development of this maturing industry The relationships between the activities of aquaculture and the environment are therefore of economic importance as well as of scientific interest and for these reasons a large international research community has developed over the past decade In this volume the resultant research is synthesised and critically reviewed providing a source of reference to the most important recent developments at research and professional level The authors are internationally recognised authorities who have made significant contributions to their respective research areas The first part of the volume is organised in terms of the major culture types This is followed by chapters of general relevance to aquaculture The volume is designed to complement *Biology of Farmed Fish* eds K D Black A D Pickering also published in this series It is directed at fish biologists shellfish biologists and environmental scientists working in the academic governmental and industrial sectors

Duarte,Nuria Marbà,Ioannis Karakassis,2007-12-29 This book provides a scientific forecast of development in aquaculture with a focus on the environmental technological social and economic constraints that need to be resolved to ensure sustainable development of the industry and allow the industry to be able to feed healthy seafood products to future generations The chapters discuss the most critical bottlenecks of the development They encompass subjects of understanding the environmental impacts the current state of the art in monitoring programs and in coastal zone management the important interactions between wild and cultured organisms including release of non native species into the wild

Aquaculture and the Environment Roger Creed,2015 Aquaculture is the science of cultivating aquatic animals and plants in fresh or marine waters It is the extended version of fishing derived from the fact that harvests of wild sources of fish and other aquatic species cannot keep up with the demand of an increasing human population Amplification of aquaculture can result in less concern for the environment and therefore the first prerequisite for sustainable aquaculture is clean water However poor management of aquatic species production can alter or even destroy existing wild habitats increase local pollution levels or negatively impact local species Keeping this in mind aquatic managers along with scientists are searching for modern and more efficient solutions to various issues regarding fish farming This book offers recent research outcomes on the relationship between aquaculture and environment and consists of case studies from all over the world with the goal of improving and performing sustainable aquaculture
