Brain Displacements and Deformations S. M. Blinkov, 2012-12-06 In writing our book we had in mind both practicing physicians and scientific personnel We hope that the former will benefit from an analysis of clinical symptoms and changes in the morphological substrate which produce them and that the latter will be interested in facts illustrating the resistance of nervous tissue to compression and displacement and in our concept of the primary role played by blood supply in the functional disturbances of a deformed brain stem Although only a short time has elapsed since the first edition of the book it has been necessary to introduce a number of addenda and corrections into the present edition The chapter Roentgenological Manifestations of Brain Displacements written by N S Plevako and Z N Polyanker has also been expanded We are glad that a competent publishing house such as Plenum Press has undertaken the American publication of the book we offer our sincere thanks to Mr George Onischenko for his excellent translation and we express our gratitude to Mezhdunarodnaya Kniga the Soviet Book Export Agency in the person of Galina Aleksandrovna Khudozhnikova for their cooperation *Brain*

biological tissues in the context of Computer Assisted Surgery CAS More specifically deformable soft tissues are addressed since they are the subject of the most recent developments in this field The pioneering works on this CAS topic date from the 1980 s with applications in orthopaedics and biomechanical models of bones More recently however biomechanical models of soft tissues have been proposed since most of the human body is made of soft organs that can be deformed by the surgical gesture Such models are much more complicated to handle since the tissues can be subject to large deformations non linear geometrical framework as well as complex stress strain relationships non linear mechanical framework Part 1 of the volume presents biomechanical models that have been developed in a CAS context and used during surgery This is particularly new since most of the soft tissues models already proposed concern Computer Assisted Planning with a pre operative use of the models Then the volume addresses the two key issues raised for an intra operative use of soft tissues models namely Part 2 how to estimate the in vivo mechanical behavior of the tissues i e what are the values of the mechanical parameters that can deliver realistic patient specific behavior and Part 3 how to build a modeling platform that provides generic real time or at least interactive time numerical simulations
