1. **Introduction**

Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The subjects were assessed at baseline and at 12 weeks for physical and psychological health. The physical health measures included body mass index (BMI), waist circumference, and blood pressure. The psychological health measures included the Beck Depression Inventory (BDI) and the State-Trait Anxiety Inventory (STAI). The results of the study showed that the walking program had a significant effect on the physical and psychological health of the subjects. The walking program significantly reduced BMI, waist circumference, and blood pressure. The walking program also significantly reduced the BDI and STAI scores. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.
