Bitopological Spaces Theory Relations With Generalized Algebraic Structures And Applications:

Bitopological Spaces: Theory, Relations with Generalized Algebraic Structures and Applications Badri

Dvalishvili, 2005-01-20 This monograph is the first and an initial introduction to the theory of bitopological spaces and its applications. In particular, different families of subsets of bitopological spaces are introduced and various relations between two topologies are analyzed on one and the same set. The theory of dimension of bitopological spaces and the theory of Baire bitopological spaces are constructed and various classes of mappings of bitopological spaces are studied. The previously known results as well as the results obtained in this monograph are applied in analysis, potential theory, general topology and theory of ordered topological spaces. Moreover, a high level of modern knowledge of bitopological spaces theory has made it possible to introduce and study algebra of new type, the corresponding representation of which brings one to the special class of bitopological spaces. It is beyond any doubt that in the nearest future the areas of essential applications will be the theories of linear topological spaces and topological groups, algebraic and differential topologies, the homotopy theory, not to mention other fundamental areas of modern mathematics such as geometry, mathematical logic, the probability theory and many other areas including those of applied nature. Key Features: First monograph is Generalized Lattices. The first introduction to the theory of bitopological spaces and its applications. Functional Analysis in Asymmetric Normed Spaces Stefan

Cobzas, 2012-10-30 An asymmetric norm is a positive definite sublinear functional p on a real vector space X . The topology generated by the asymmetric norm p is translation invariant so that the addition is continuous but the asymmetry of the norm implies that the multiplication by scalars is continuous only when restricted to non-negative entries in the first argument. The asymmetric dual of X meaning the set of all real-valued upper semi-continuous linear functionals on X is merely a convex cone in the vector space of all linear functionals on X . In spite of these differences, many results from classical functional analysis have their counterparts in the asymmetric case by taking care of the interplay between the asymmetric norm p and its conjugate. Among the positive results, one can mention Hahn-Banach type theorems and separation results for convex sets, Krein-Milman type theorems, analogs of the fundamental principles: open mapping, closed graph and uniform boundedness theorems, an analog of the Schauder's theorem on the compactness of the conjugate mapping. Applications are given to best approximation problems and as relevant examples, one considers normed lattices equipped with asymmetric norms and spaces of semi-Lipschitz functions on quasi-metric spaces. Since the basic topological tools come from quasi-metric spaces and quasi-uniform spaces, the first chapter of the book contains a detailed presentation of some basic results from the theory of these spaces. The focus is on results which are most used in functional analysis: completeness, compactness and Baire category, which drastically differ from those in metric or uniform spaces. The book is fairly self-contained, the prerequisites being the acquaintance with the basic results in topology and functional analysis, so it may be used for an introduction to the subject. Since new results in the focus of current research are also included, researchers in the area can use it as a reference.
