Blood Use In Cardiac Surgery

Blood Use In Cardiac Surgery:

Blood Use in Cardiac Surgery N. Friedel, R. Hetzer, D. Royston, 2013-06-29 Cardiac surgery has developed dramatically since the first open heart operations were performed in the mid 1950s. Although the improvement of surgical technique, extracorporeal circulation, and postoperative management has contributed to a marked reduction of morbidity and mortality, the development of cardiac surgery to its present state would not have been possible without blood substitution by homologous donor blood. Only 20 years ago open heart operations required an average of 8 units of blood. The excessive need of donor blood in those early days was mainly due to premature surgical technique, insecure control of anticoagulation, severe blood trauma by extracorporeal circulation, and the lack of retransfusion technologies that would have allowed the reuse of shed mediastinal blood. The introduction of new technologies such as normovolemic hemodilution, intraoperative autotransfusion, postoperative return of shed mediastinal blood, and predonation of autologous blood has greatly reduced donor blood requirements. At present, the majority of routine coronary artery surgical procedures can be performed without any blood transfusion. Blood loss, however, may be considerable in patients undergoing complex valve surgery or reoperations, as they often require several units of transfused blood. Blood conservation has now become an area of major interest for the cardiac surgeon. This increased concern is caused by infectious complications of blood transfusion, in particular hepatitis and more recently AIDS.

Blood Use in Cardiac Surgery N. Friedel, 1991-01 **Blood Conservation in Cardiac Surgery** Karl H. Krieger, O. Wayne Isom, 2012-12-06 Drs Karl Krieger and Wayne Isom, two of the foremost cardiothoracic surgeons, have brought together many of the top cardiologists and hematologists, as well as most of their department at the New York Hospital Cornell Medical Center, to produce an impressive book on blood conservation and transfusion in cardiac surgery. The book will serve as the most current reference source on all aspects of blood conservation, from the use of erythropoietin to the benefits of postoperative blood salvage. In addition, the book outlines an overall clinical approach to blood transfusion and conservation. The subject matter covers numerous areas involved in the preoperative considerations in cardiac surgery, the intraoperative decision making in cardiac surgery, postoperative bleeding and management, and a section on the algorithm for bloodless surgery at the New York Hospital Cornell Medical Center. **Risk**
