

Acute Confusional States and Drug Therapy

Intensive treatment is critical in affecting the acute confusional syndrome. The physician must identify the underlying cause, correct it, and provide supportive care. The most important goal is to correct the underlying cause as quickly as possible in order to prevent permanent damage to the brain.

Drug treatment should be simple and limited in scope. When possible, the physician should use oral therapy. If the patient is unable to take oral medication, the physician should use intramuscular or intravenous therapy. The physician should avoid the use of sedatives and hypnotics, which can worsen the confusion. The physician should avoid the use of anticholinergic drugs, which can also worsen the confusion. The physician should avoid the use of drugs that can cause delirium, such as corticosteroids and certain antibiotics.

Chlorpromazine or thioridazine in a dose of 25-50 mg given in a single daily dose may be helpful. An intramuscular dose has a considerable sedative effect, but 24-48 hours sleep may help the return to normal state in a few cases.

Drug treatment at this stage should be carefully monitored. Antidopaminergic drugs may be helpful, but before resorting to them, consultation with a psychiatrist is advisable. Haloperidol is effective. One old-fashioned and simple drug, paraldehyde, is very safe and can be given by mouth or per rectum, is likely to cause much damage if used intramuscularly, however.

Prognosis

The prognosis depends to a considerable extent on the severity of the underlying precipitating disease and how well and quickly it responds to treatment. In Hallikainen's series (15), 25% of his cases of toxic confusional states died, the 25% recovered to be discharged, the remainder were still in the hospital at the end of the study period. Precipitating dementia, defective hearing and vision, Parkinsonism, and advanced age were frequent predisposing factors; pneumonia, cardiac failure, urinary infection, carcinomatosis, and hypokalemia were the most common precipitating factors.

Kral (23) has described what became of individuals suffering from acute

confusional states who were hospitalized in a geriatric hospital. Most of the patients recovered within a few days, but some died. The patients who died were usually those who had severe underlying disease, such as pneumonia, heart failure, or renal failure. The patients who recovered were usually those who had mild underlying disease, such as urinary infection or hypokalemia. The patients who recovered were usually discharged within a few days, but some were discharged within a few weeks. The patients who died were usually discharged within a few days, but some were discharged within a few weeks.

Chronic Dementing Illness

Freund and Miller (27) define dementia as "a syndrome, arising from cerebral disease, which produces a disturbance of memory, intellect, and personality, and a gradual development of the disease." In other words, dementia is a syndrome that arises from cerebral disease and is characterized by a disturbance of memory, intellect, and personality. The syndrome is characterized by a gradual development of the disease. The syndrome is characterized by a disturbance of memory, intellect, and personality. The syndrome is characterized by a gradual development of the disease.

Most cases of dementia are caused by cerebral disease. The most common cause of dementia is Alzheimer's disease. Other causes of dementia include vascular disease, Parkinson's disease, and certain infections. The syndrome is characterized by a disturbance of memory, intellect, and personality. The syndrome is characterized by a gradual development of the disease. The syndrome is characterized by a disturbance of memory, intellect, and personality. The syndrome is characterized by a gradual development of the disease.

Etiology

As with acute confusional states, there is a multiplicity of causes for chronic dementing illness (Table 5-2). The majority of cases are caused by conditions in the primary group and first two categories of the secondary group (see section on Aging of the Brain in Ch. 4, Brain Failure). The importance of the other conditions is that there are cures available for many of them. They represent the small group of cases for whom adequate treatment may achieve cure.

Included in the group of dementing illness caused by vascular disease is an important subgroup, which has been well described by Adams and Marston (2)—mental barriers to recovery from strokes. Inability to learn, for reasons other than clouding of consciousness to full-blown dementia, is the first one

A.-M. Ferrandez, N. Teasdale, 1995-12-11 Recently studies on aging processes and age related changes in behavior have been expanding considerably probably due to the dramatic changes observed in the demographics This increase in the overall age and proportion of elderly people has heightened the severity of problems associated with the safety and well being of elderly persons in everyday life Many researchers working on motor control have thus focused more intensely on the effects of age on motor control This new avenue of research has led to programs for alleviating or delaying the specific sensory motor limitations encountered by the elderly e g falls in an attempt to make the elderly more autonomous The aggregation of studies from different perspectives is often fascinating especially when the same field can serve as a common ground between researchers Nearly all contributors to this book work on sensory motor aging they represent a large range of affiliations and backgrounds including psychology neurobiology cognitive sciences kinesiology neuropsychology neuropharmacology motor performance physical therapy exercise science and human development Addressing age related behavioral changes can also furnish some crucial reflections in the debate about motor coordination aging is the product of both maturational and environmental processes and studies on aging must determine how the intricate interrelationships between these processes evolve The study of aging makes it possible to determine how compensatory mechanisms operating on different subsystems and each aging at its own rate compensate for biological degenerations and changing external demands This volume will contribute to demonstrating that the study of the aging process raises important theoretical questions **Annual Review of Gerontology and Geriatrics, Volume 4, 1984**, 1984-01-15 The key to preventing many adult diseases lies in childhood when lifetime patterns of diet exercise and moderation are most often set Authored by an interdisciplinary team including nurses psychologists nutritionists and researchers this book provides a research based examination of the interplay between health and behavior in childhood and adolescence leading to either positive or negative health outcomes It examines issues such as What role does temperament play in at risk behavior How can we improve dietary choices How can we reduce the cycle of physical inactivity leading to obesity What makes some children more prone to substance abuse This book provides a long range perspective on health promotion by examining its roots in the early years of life **Clinical Pharmacology & Therapeutics** Paul Turner, C. Padgham, Alan Hedges, 1980-06-18 Cognitive and Behavioral Performance Factors in Atypical Aging Mark L. Howe, Michael J. Stones, Charles J. Brainerd, 2012-12-06 It is a truism that as we age there are a number of underlying physiological changes conspiring to alter our level of behavioral and cognitive function ing Despite the inherent interrelatedness of these behavioral and cognitive changes all too often the papers we read confine themselves to specific isolated components of the developing process Although exceptions nat urally

exist we believe that these exceptions should become rule Although an integrated approach is important in all areas of adult development it is perhaps particularly germane in the study of atypical aging Here changes in overall functioning can occur in rapid succession with the synchrony of decline between different subprocesses making it difficult to factor changes in one process from changes in another For example because changes in cognitive functioning co occur with other dramatic changes in motoric response capacities it is unclear how one can effectively study changes in the ability to cognize independent of changes in the very mechanisms ability to execute motor sequences so often used to index cognitive performance
